| **Hardiness Zone** | 4-9 |
| **Product Use** | Topfpflanze |

# TECHNICAL GUIDE

Gaultheria procumbens Merry Berry

**Kornablage**
Sow 6-8 seeds per cell in a 128 or 264 tray (or comparable format).

**Keimbedingung**
20-30 days

**Media**
Fine lose substrates or glued plugs are suitable growing media. Maintain a pH value of around 4 (3.8 to 4.5).
In the beginning, the EC value should not exceed 1 to 1.25 mS/cm. Always use or mix with rainwater, if possible.
Higher light and temperature levels will encourage germination. A soil temperature of 20 °C and high humidity ensure the best germination results. The first phase, from germination until the established young plant, is approximately 8 weeks.
Finished young plants after approximately 13 weeks.

**Temperatur**
68 °F / 20 °C
